ACCESSIBILITY COMPLIANCE · WCAG 2.2 LEVEL AA

Manual Audit Checklist

22 accessibility checks that require human evaluation. Automated tools cannot fully assess these criteria — they need expert judgement, assistive technology testing, and real user evaluation.

- 22 MANUAL CHECKS
- WCAG 2.2 LEVEL AA
- HUMAN EVALUATION REQUIRED
- DEVIES WCAG AGENT

HOW TO USE THIS CHECKLIST

Work through each item with a qualified accessibility specialist. Use a real screen reader (NVDA, JAWS, or VoiceOver), assistive technology, and keyboard-only navigation. Tick the checkbox when the criterion has been verified in your specific context.

MANUAL EVALUATION

Checks That Automation Misses

These 22 checks require human evaluation — automated tools cannot fully assess them. Each item maps to a WCAG 2.2 success criterion and must be verified in the actual context of use.

01 ☐ **Text Legibility**
Can all text be read comfortably at normal zoom levels? Check font size, line height, contrast and overall readability.

02 ☐ **Interactive Target Size**
Are all interactive elements (buttons, links, form controls) large enough for users with motor impairments? WCAG 2.2 requires 24×24 px minimum.

03 ☐ **Keyboard Flow**
Can all interactive elements be reached and activated using only a keyboard? Check for logical tab order and no keyboard traps.

04 ☐ **Visible Focus Indicator**
Is the keyboard focus indicator visible and clear on every interactive element? Verify with browser zoom at 200%.

05 ☐ **Skip Navigation**
Does the skip-link actually work and move focus past repeated navigation? Test with screen readers (NVDA, VoiceOver).

06 ☐ **Reflow at 320 px**
Does all content reflow to a single column at 320 px viewport width without horizontal scrolling or content loss?

07 ☐ **Text Resize to 200%**
Can text be resized to 200% via browser settings without loss of content or functionality?

08 ☐ **Zoom Support**
Does the page work at 400% browser zoom? Check for overlapping elements, hidden content, and broken layouts.

09 ☐ **Error Identification**
Are form errors clearly identified in text, announced to screen readers, and linked to the specific field?

10 ☐ **Error Recovery**
Does the site provide helpful error suggestions and allow users to correct mistakes before submitting irreversible actions?

11 ☐ **Timeout Warnings**
Are users warned before sessions expire and given at least 20 seconds to extend? Relevant for forms and logged-in areas.

12 ☐ **Moving / Blinking Content**
Can all moving or auto-updating content be paused, stopped, or hidden? Verify carousels, banners, and animations.

13 ☐ **Audio / Video Controls**
Does all media have accessible controls (play, pause, volume)? Are controls keyboard-operable and labelled?

14 ☐ **Captions Quality**
Are captions accurate, synchronised, and include speaker identification and relevant sound descriptions?

15 ☐ **Reading Order**
Does the DOM reading order match the visual order? Test by linearising CSS and navigating with a screen reader.

16 ☐ **Consistent Navigation**
Are repeated navigation components (menus, breadcrumbs) presented in the same order and location across all pages?

17 ☐ **Consistent Labels**
Are components with the same function labelled consistently across the entire site?

18 ☐ **Plain Language**
Is content written at a reading level appropriate for the audience? Are technical terms explained?

19 ☐ **Complex Instructions**
Are instructions for forms and tasks clear and not reliant on sensory characteristics (colour, shape, position) alone?

20 ☐ **Cognitive Load**
Is the interface simple and consistent enough for users with cognitive disabilities? Avoid unexpected changes of context.

21 ☐ **Time-Based Interactions**
Can users complete all tasks without time pressure? Are timed responses adjustable or removable?

22 ☐ **Assistive Technology Testing**
Has the site been tested with screen readers (NVDA, JAWS, VoiceOver) and other assistive technologies across key user journeys?

IMPORTANT: AI FINDINGS SHOULD BE VALIDATED

Automated analysis is a powerful first step — but accessibility compliance ultimately requires human expertise.

Some issues require manual testing, user experience evaluation, and expert judgment to confirm severity and compliance level.

Our accessibility specialists can review, validate, and help you implement the fixes so your product meets real-world accessibility standards.
